**Fruit flesh delicacy**  
**Crispy and juicy**

**Crispy and juicy**

**Sweet and delicious**

**Very small stone**

**flesh is pure white**

**WANHUITONGYANG**

**万汇通洋**

The plantation of Ningbo WanHuiTongYang Fruit and Vegetable MFG Co.,Ltd were located at the hill which altitude is around 1000meters, with abundant light and heat resources, large temperature difference between day and night.

Our planting soil is semi sandy and semi muddy loam.

Half sand can loosen and aerate the soil, while it can also filter water. Half mud can retain water, resist drought, dissolve soluble fertilizers, and have an adsorption effect.

Our plantation soil is rich in humus.

Humus can provide nutrition for pear trees for a long time and provide strong stamina for the growth of pear trees through microbial action. Of course, the retention time of humus is limited, but the growth of pear trees is an indispensable material, which can be gradually supplemented after planting.

It is juicy, sweet with acidity, rich in nutrients, and contains a variety of vitamins and fiber.

It can be eaten raw or steamed before consumption.

Pear fruits, eaten raw, can clear the heat in the six organs, while cooked can nourish the yin of the five organs.

They also have high medicinal value and have various effects such as moistening the lungs, reducing weight, relieving cough, reducing fire, and clearing the heart. It can also treat diseases such as sore throat, tracheitis, and pertussis.

It can also be processed into pear juice, pear wine, preserved pears, pear paste, and canned goods.

Each pear in our plantation was wrapped in paper bags

Advantages of paper bags:

- 1, Reduce pesticide residues in fruits
- 2, Physical conditions prevent diseases and pests
- 3, Improve the appearance quality of fruits

Pear packing
